Project Name:	Automated Network Request Management System
Maximum Marks:	

PS-1: The End-User Persona (The Requester)

User Profile

I am an enterprise employee (e.g., Abel Tuter) who requires the provisioning of a new physical network connection or the immediate relocation of existing corporate hardware assets.

Core Objective

My goal is to seamlessly submit hardware profiles, inventory requirements, and physical location coordinates to the IT Infrastructure team to minimize workspace setup downtime.

Technical Friction Points

- **Ambiguous Data Ingestion:** The legacy service catalog interface is confusing and lacks rigid front-end validation rules, resulting in incomplete ticket submissions.
- **Communication Overhead:** The current process relies heavily on manual forms and offline email chains to clarify missing physical specifications.
- **Static Interface Layout:** The form fails to auto-populate my profile identity data or employ conditional client-side UI policies to hide complex relocation parameters unless contextually necessary.

Operational & Emotional Impact

This structural gap creates severe administrative friction, leaving me feeling frustrated, digitally isolated, and operationally delayed when trying to establish my workspace connectivity.

The screenshot displays a web interface for a 'Network Request' form. The breadcrumb trail at the top reads: Home > Service Catalog > Network Requests > Network > Network Request. A search bar labeled 'Search Catalog' is located in the top right corner. The main heading is 'Network Request' with a sub-heading 'Network request Management'. Below this, there is a section for 'Indicates required' with a red asterisk. It contains three input fields: 'Proof of Document' (with a placeholder 'network request proof'), 'User name' (with a placeholder 'abel.tuter'), and 'Phone Number' (with a placeholder '9997846376'). There is also a field for 'Email id' (with a placeholder 'abel.tuter@example.com'). On the right side, there is a sidebar with a 'Quantity' dropdown set to '1', a 'Price' of '\$130.00', and a 'Delivery Time' of '2 Days'. Below these are buttons for 'Add to Cart', 'Save as Draft', and 'Order Now'.

PS-2: The Backend Administrator Persona (The Fulfiller)

User Profile

I am an IT Network Infrastructure Administrator responsible for validating hardware allocations, coordinating technical deployments, and managing regional resource sign-offs.

Core Objective

My goal is to maintain a zero-error, persistent configuration management database (CMDB) ledger tracking all network infrastructure assets across the enterprise ecosystem.

Technical Friction Points

- **Metadata Deficiency:** Inbound provisioning forms frequently arrive missing critical parameters, forcing me to manually verify user profiles and clear up data inconsistencies.
- **Manual Bottlenecks:** I must manually pursue managers for sign-offs and transcribe hardware configurations line-by-line into disconnected spreadsheet tracking files.
- **Lack of Orchestration:** The current architecture completely lacks strict, entry-gate input validation and an automated server-side engine (such as Flow Designer) to handle multi-stage approval routing and direct database commits.

Operational & Emotional Impact

This system deficiency introduces significant technical debt, leaving me feeling overwhelmed by repetitive administrative workflows and anxious about data corruption, clerical errors, or broken asset dependencies.
